

A Model of Perception

In your waking state, you are aware of and interact with your external world. Sensations (images, sounds, smells, touch, tastes) from your sense organs are transmitted to your mind. There, they are modified by your conditioned filters and transmitted to your ego.

Your ego may then focus your attention to get more data, but ultimately it collects, evaluates and analyzes the information. It then arrives at a conclusion, decision or action about what is happening in your world and what to do or not do. This process creates your perceptions of your world and how it works.

Your ego determines your perceptions, which creates your worldview.

Also, in your waking state, your ego may receive information from THAT which has many names or is nameless. How much your ego uses the information from THAT to arrive at a conclusion depends on your mind filters. If you are not aware of the filters in your mind, then your perceptions of the world and how the world works is completely limited by your conditioned filters in your mind.

The more you understand your mind filters and how they work, the more transparent (less filtering) they become. This changes your perceptions of your world and how it works. This gives you more choices and clarity in your life.
